

Erick Garcia

QA Automation Engineer (SDET)

erick.garcia.qa@gmail.com | +55 16 99310-5737 | [linkedin.com/in/erick-garcia-399b2b161](https://www.linkedin.com/in/erick-garcia-399b2b161) | github.com/Erick-oGarcia | erickogarcia.github.io

PROFESSIONAL SUMMARY

QA Automation Engineer (SDET) with 5+ years of experience in agile environments and business-critical systems. Specialized in E2E and API test automation with Playwright and Cypress (TypeScript/JavaScript), API performance testing with k6 and desktop automation with TestComplete, with a focus on regression stability, CI/CD integration (GitHub Actions, Azure DevOps) and continuous quality improvement. Designs and maintains end-to-end automation solutions from scratch, validating not only the UI but data persistence in Oracle PL/SQL, MySQL and Firebase; applies BDD (Gherkin, Jira + Zephyr), consumer-driven contract testing with Pact and cross-browser/mobile coverage with BrowserStack. Uses AI-assisted development (Claude Code, Cursor, Zed, Kiro) to generate and refactor test code. Open-source work in Playwright/TypeScript and Java (Selenium, TestNG, RestAssured) at github.com/Erick-oGarcia.

TECHNICAL SKILLS

Test Automation (current stack): Cypress | Playwright | TestComplete | JavaScript/TypeScript | End-to-End Testing | API Test Automation | Page Object Model | Custom Commands | Regression Testing

APIs & Data Validation: Postman | Swagger | REST APIs | Oracle PL/SQL | MySQL | Firebase | Data Validation | Database Consistency

CI/CD & Quality Engineering: GitHub Actions | Azure DevOps | Docker | Docker Compose | Test Pipelines | Continuous Integration

Performance & Contract Testing: k6 | Pact (consumer-driven contracts) | Performance gates in CI | JMeter

AI-Assisted Development: Claude Code | Cursor | Zed | Kiro | AI-assisted test generation and refactoring

Tools & Methodologies: Jira | Zephyr | BDD (Gherkin) | Scrum | Confluence | BrowserStack | DevTools

Also used in personal projects: Java | Selenium WebDriver | TestNG | RestAssured

PROFESSIONAL EXPERIENCE

QA Automation Engineer | Software Quality Analyst CURRENT ROLE

TOTVS

Retail & Supermarket ERP — Consinco product line
Jul 2022 – Present | Brazil

- Built and maintain the Cypress regression suite for the Web Cost Table Import module (Page Object Model), with PL/SQL queries validating data directly in Oracle rather than only on the UI — reducing the module’s release regression from ~3 days of manual testing to ~15 minutes.
- Run manual testing and write validation scenarios in Jira (Zephyr), executing the full regression suite in the validation cycle before each release.
- Use BDD to model scenarios in Gherkin within Jira, with traceability for each automation scenario, and manage automation improvements in the backlog for current and future releases.
- Run manual tests on the Minhas Compras app via BrowserStack, validating key flows across multiple devices and browsers.
- Validate the Minhas Compras app against NoSQL (Firebase) and Oracle PL/SQL databases for data consistency, writing query scripts and checking purchase flows.
- Write test scenarios that surface existing bugs and prevent regressions in legacy modules, contributing to product stability over time.
- Integrate automated test execution into CI/CD pipelines using GitHub Actions and Azure DevOps.

KEY RESULTS

- Over 99% automated validation coverage on the Table Import module, with PL/SQL integration (180+ test scenarios)
- Release regression cycle reduced from ~3 days to ~15 minutes
- 100% regression coverage on critical business features within the module
- Legacy system stabilized, enabling safer feature expansion

Technologies: Cypress | Playwright | TestComplete | JavaScript | Oracle PL/SQL | Firebase | Jira | Zephyr | BrowserStack | GitHub Actions | Azure DevOps | Scrum

Quality Assurance Intern

Prema – PREventive MAintenance Car

Dec 2021 – Jun 2022 | Brazil

- Ran several testing types — system, exploratory, regression, unit, integration and beta — applying techniques such as combinatorial analysis and boundary-value testing.
- Developed backend automated tests using Mocha and Chai for API assertions, and frontend automation using Cypress.
- Performed manual API testing using Postman and Insomnia.
- Documented test scenarios and set up quality metrics to track bug density per screen.
- Used Browser DevTools for debugging and fault isolation in web applications.

Technologies: Cypress | Mocha/Chai | Postman | Insomnia | DevTools

PROJECTS

Caronapass (solo product, in production)

caronapass.com.br • [App Store](#) • [Google Play](#)

A ride-sharing app for university students in the interior of São Paulo, which I design, build and ship solo. In production since January 2026 with 102 SQL test files, 27 API suites and 59 unit tests running in GitHub Actions CI (lint, Jest, PostgreSQL and API smoke stages). Quality is owned end to end: a documented six-level test pyramid with written release gates, requirements traceability from business rule to test across 34 scenario documents, and coverage matrices that declare which cases are deliberately left uncovered.

- Applying ISTQB CTFL test design techniques, mapping the system's states against the running code surfaced 82 edge cases, including three race conditions where a scheduled job could slip between a read and a write.
- Adversarial testing of the PII filter: zero-width characters and spaced digits used to smuggle phone numbers and e-mails past the block, with cross-layer parity asserting that the client filter and the database trigger reach the same verdict.
- Built with an AI-assisted workflow (Claude Code, Cursor, Zed): I specified the architecture, business rules and test strategy and reviewed every change, rather than hand-writing the implementation. That is why verification is independent of the application: around 190,000 lines of generated application and SQL code are held to checks that read the database directly.

Stack: React Native | Expo | TypeScript | PostgreSQL | PostGIS | SQL Testing | Jest | GitHub Actions

Toolshop Quality Harness (personal project)

github.com/Erick-oGarcia/toolshop-quality-harness

A full-stack quality harness for a real e-commerce demo app (Toolshop), self-hosted with Docker Compose: UI, API and database checks live in the same Playwright/TypeScript suite, running in GitHub Actions CI. Every check was shown failing before being trusted (docs/detection-proof.md).

- Tests read the database as a source of truth independent from the application — the check caught the API returning HTTP 200 for products already deleted from the database, a defect neither a UI nor an API test would catch.
- k6 performance gate with a budget auto-calibrated from the same machine in the same run (p95 of 126 ms on the laptop vs 53 ms on the GitHub runner), instead of a fixed millisecond threshold.
- Consumer-driven contract with Pact: the client reads 5 fields out of a 12-field payload and the contract demands only those 5, leaving the provider free to evolve everything else.

Stack: Playwright | TypeScript | Docker Compose | k6 | Pact | MySQL | Oracle | GitHub Actions | Node.js | ESLint/Prettier

Selenium JavaTestMatrix (personal project)

github.com/Erick-oGarcia/JavaTestMatrix • Allure report: erick-ogarcia.github.io/JavaTestMatrix

A test automation framework for UI and API testing, built with Java, Selenium WebDriver, TestNG and RestAssured. Uses the Page Object Model pattern, Allure for reporting, and GitHub Actions for CI.

Stack: Java | Selenium WebDriver | RestAssured | TestNG | GitHub Actions | Allure Reports | Maven | Page Object Model

EDUCATION

Bachelor's Degree in Information Systems

FATEC Franca – College of Technology "Dr. Thomaz Novelino"

2018 – 2022

CERTIFICATIONS

- ISTQB Certified Tester – Foundation Level (CTFL 4.0), valid since 2025
- Microsoft Certified: Azure AI Fundamentals
- Introduction to Software Quality
- Cypress Discovery
- JMeter – Performance Testing
